

Ramaiah Institute of Technology
(Autonomous Institute, Affiliated to VTU)

Department of CSE

Programme: B.E
Course: Computer Organization

Term: Jan to May 2019
Course Code: CS45

Activity V: Designing an ALU to perform arithmetic and logical functions using Logisim simulator.

| | | |
|-------------------------|----------------------------------|--------------|
| Name: Padi Suhas | Marks: /10 | Date: |
| USN: 1MS18CS087 | Signature of the Faculty: | |

Objective: To simulate the working of Arithmetic and Logical Unit using simulator.

Simulator Description: Logisim is an educational tool for designing and simulating digital logic circuits. With its simple toolbar interface and simulation of circuits as you build them, it is simple enough to facilitate learning the most basic concepts related to logic circuits. With the capacity to build larger circuits from smaller sub circuits, and to draw bundles of wires with a single mouse drag, Logisim can be used (and is used) to design and simulate entire CPUs for educational purposes.

Activity to be performed by students:

List out the steps in designing ALU

Steps in designing ALU

Step 1: Add 2 input pins

Drop two east facing input pins on the 4 bits each. Label A & B and ensure each input is 4 bits

Step 2: Add the adder / subtractor

Now we add the sub circuits earlier.
Select the circuits under the main project folder.

Step 3: Add the multipliers

These take one or more inputs & generate a single output. In logicism, multiplexer icon & drop them in two columns.

Step 4: add controls

Drop two pins on the ~~two~~ west-facing with 1 data bit label them 0 & 1 respectively

Step 5 : add a splitter

Now, we add splitter in our circuit that takes on line from the second multiplier & splitter to 4 inputs to OR gate for a 4 bit ALU.

Step 6 : Add another OR gate after the first, which has 4 inputs. To the right of the OR gate, add a NOT gate. This arrangement accounts for zero. The NOT gate following OR gate arrange this

Step 7: Add a result pin for the mux

We handled the zeroes coming to the mux, but we also need to account for valid combination inputs from A, B.

Activity VI: Designing memory system using Logisim simulator.

| | | |
|-------------------------|----------------------------------|--------------|
| Name: Padi Suhas | Marks: /10 | Date: |
| USN: 1MS18CS087 | Signature of the Faculty: | |

Objective: To simulate the writing operation on memory.

Simulator Description: Logisim is an educational tool for designing and simulating digital logic circuits. With its simple toolbar interface and simulation of circuits as you build them, it is simple enough to facilitate learning the most basic concepts related to logic circuits. With the capacity to build larger circuits from smaller sub circuits, and to draw bundles of wires with a single mouse drag, Logisim can be used (and is used) to design and simulate entire CPUs for educational purposes.

Activity to be performed by students:

List out the steps in designing memory system

Lab 6

Step 1: add RAM

Select a separate LOAD & STORE operation for RAM.

Step 2: Add counter

Connect counter, clock & controller buffers to the RAM

Step 3: Add TTY

To display the data.

Step 4: Add Random Generator

To generate different address location. Add inputs & another controller Buffer to the random generator.

Step 5: Add Button

Connect Button to Counter.

Observations and Snapshots:
